

Charts and Plots

Data Visualization with Seaborn

Your goal: You have a script that generates violin plots showing exam scores across five schools. It works, but the output doesn't look quite right. Your job is to make four changes so it matches the expected result.

Your Starting Point

Run `code.py` to generate this

Your Expected Result

Edit `code.py` — complete the 4 subtasks below. Compare your output to the expected result as you go.

Subtasks

1 Arrange plots in a 2x2 grid

The four plots are stacked in a single column. Rearrange them into a 2-row, 2-column grid.

2 Add box plots inside each violin

The violins are currently hollow. Add a box plot inside each one to show the median, quartiles, and whiskers.

3 Overlay individual data points

Add a strip plot (jittered dots) on top of the violins so each individual student score is visible.

4 Remove axis spines

All axis borders (spines) are currently visible. Remove the left and bottom spines for a cleaner look.

Edit `code.py` to make these changes. Compare your output to `III-Your-Expected-Result.png` as you go.
