

Image Manipulation

Image Processing with Pillow (PIL)

Your goal: You have a script that generates team profile cards showing each team's name, members (as dots), and status. The output has several problems — the cards are upside-down, blurry, in a single column, and have thick borders. Fix these four issues to match the expected result.

Your Starting Point

Run `code.py` to generate this

Your Expected Result

Edit `code.py` — complete the 4 subtasks below. Compare your output to the expected result as you go.

Subtasks

1 Arrange cards in a 2x2 grid

The four cards are stacked in a single column. Change the layout so they appear in a 2-row, 2-column grid.

2 Reduce the border thickness

The dark border around each card is 8 pixels wide, making it look heavy. Reduce it to 2 pixels for a cleaner appearance.

3 Fix the card orientation

Each card is rotated 180 degrees, so everything appears upside-down. Remove the rotation so cards display correctly.

BEFORE

AFTER

4 Remove the blur effect

A Gaussian blur is applied to the entire image, making everything fuzzy. Remove it so the output is crisp and readable.

BEFORE

AFTER (FINAL)

Edit `code.py` to make these changes. Compare your output to `III-Your-Expected-Result.png` as you go.
